

Project

Plate Tectonics

PURPOSE

- Plot key geologic events and correlate them to tectonic plate boundaries

INTRODUCTION

In the 1960s and 1970s it was becoming obvious that the map of Earth's continents has been continuously changing over a large portion of geologic history.

Fig. 2-1

Earth's Continents Over Last 225 Million Years
 The theory of plate tectonics explains the drift of continents and related geological events

Continental land masses crashed into and moved away from each other for over 2.0 billion years. These movements can be inferred from present-day geologic features resulting from these collisions and breakups. Rocks and fossils found in western Africa are also found in eastern South America. And scratches left on rocks by moving glaciers suggest how continents have moved over the last 300 million years.

The idea of drifting continents was first proposed in 1912 by Alfred Wegener, who observed that the continents seem to fit together like the pieces of a puzzle. Although the evidence suggested that Wegener was correct, he could not find a mechanism to explain how whole continents could move thousands of miles across the Earth's surface.

It is now believed that the continents move on pieces of the Earth's crust called **tectonic plates**. The surface of the Earth seems to be divided into seven or eight major plates and maybe a dozen smaller ones. The best explanation for the mechanism is that heat escaping from the planet's interior creates convection currents that move the plates into and away from each other. From a geological point of view, the most interesting places are the plate boundaries where the plates collide, separate, or slide past each other. Scientists infer the size, shape, and location of the plates by a process similar to the one you will undertake in this project.

In this investigation you will plot the locations of recent earthquakes, volcanic eruptions, and mountain ranges on a world map (see Fig. 2-2). These events are not evenly distributed over the Earth. You will be asked to look for patterns in the locations of these occurrences globally and discuss how they affect the planet and its inhabitants.

Procedure

Step 1 Go to the following Internet site:

http://earthquake.usgs.gov/eqcenter/recenteqsww/Quakes/quakes_all.php

Using small circles as markers, mark on the world map the location of the 25 most recent earthquakes that are not in the same locale.

Step 2 Plot the location of the following volcanoes, using small triangles on the map.

Mt. Etna, Italy - 37.73N, 15.00E	Blup Blup, Papua New Guinea - 3.5S, 144.6E
Ayelu, Ethiopia - 10.082N, 40.702E	Pinatubo, Philippines - 15.13N, 120.35E
Likaiu, Kenya - 2.17N, 36.36E	Tambora, Indonesia - 8.3S, 118.0E
White Island, New Zealand - 37.52S, 177.18E	Gamalama, Indonesia - 0.8N, 127.3E
Santorini, Greece - 36.4N, 25.4E	Irazu, Costa Rica - 9.979N, 83.853W
Askja, Iceland - 65.03N, 16.75W	Lascar, Chile - 23.32S, 67.44W
El Chichon, Mexico - 17.4N, 93.2W	Nevado del Ruiz, Columbia - 4.9N, 75.3W
Mt. Wrangell, USA - 62.66N, 144.12W	Krashennnikov, Russia - 54.58N, 160.26E
Redoubt, USA - 60.5N, 152.7W	Fuji, Japan - 35.4N, 138.7E
Mount Rainier, USA - 46.58N, 121.75W	Chaine des Puys, France - 45.5N, 2.8E
Lassen Peak, USA - 40.5N, 121.5W	Soufriere Hills, Montserrat - 16.7N, 62.2W
Unimak Island, USA - 54.47N, 163.9W	Ararat, Turkey - 39.70 N, 44.28 E
Mt. Pelee, West Indies - 14.8N, 61.1W	Savo, Solomon Islands - 9.1S, 159.8E

Step 3 Again, using the map, shade in locations for the following mountain ranges.

Alps

California Coast Ranges

Karakoram

Andes

Carpathians

Mid Ocean Ridges

Appalachians

Cascades

Scandinavian Mts.

Atlas

Dolomites

Sierra Nevada

Balkin Mts.

Himalaya

Urals

Fig. 2-2

World Map

1a. What patterns do you observe in the locations of these earthquakes, volcanoes, and mountain ranges?

b. Why do these events seem common in some areas on Earth and rare in others?

c. Using Fig. 2-3, compare your plotted positions with plate boundary locations. Describe any correlations.

Fig. 2-3: Earth's Plate Boundaries

- d. How does the theory of Plate Tectonics explain these similarities of location? Describe how the theory of Plate Tectonics is strengthened by these patterns.

2. What is meant by the term *Ring of Fire*?

- 3a. How do the Ayelu and Likaiu volcanoes fit into the pattern you have observed?

- b. What processes are going on in eastern Africa? Explain what is meant by a *triple junction*.

- c. About two hundred million years ago a similar process occurred. (Refer back to **Fig. 2-1**, historical maps of Earth's drifting continents.) Describe this process.

- 4a. What are *hot spots*? Look at **Fig. 2-4**, showing a geological section of the Hawaiian Islands. What do hot spots tell us about plate movement?

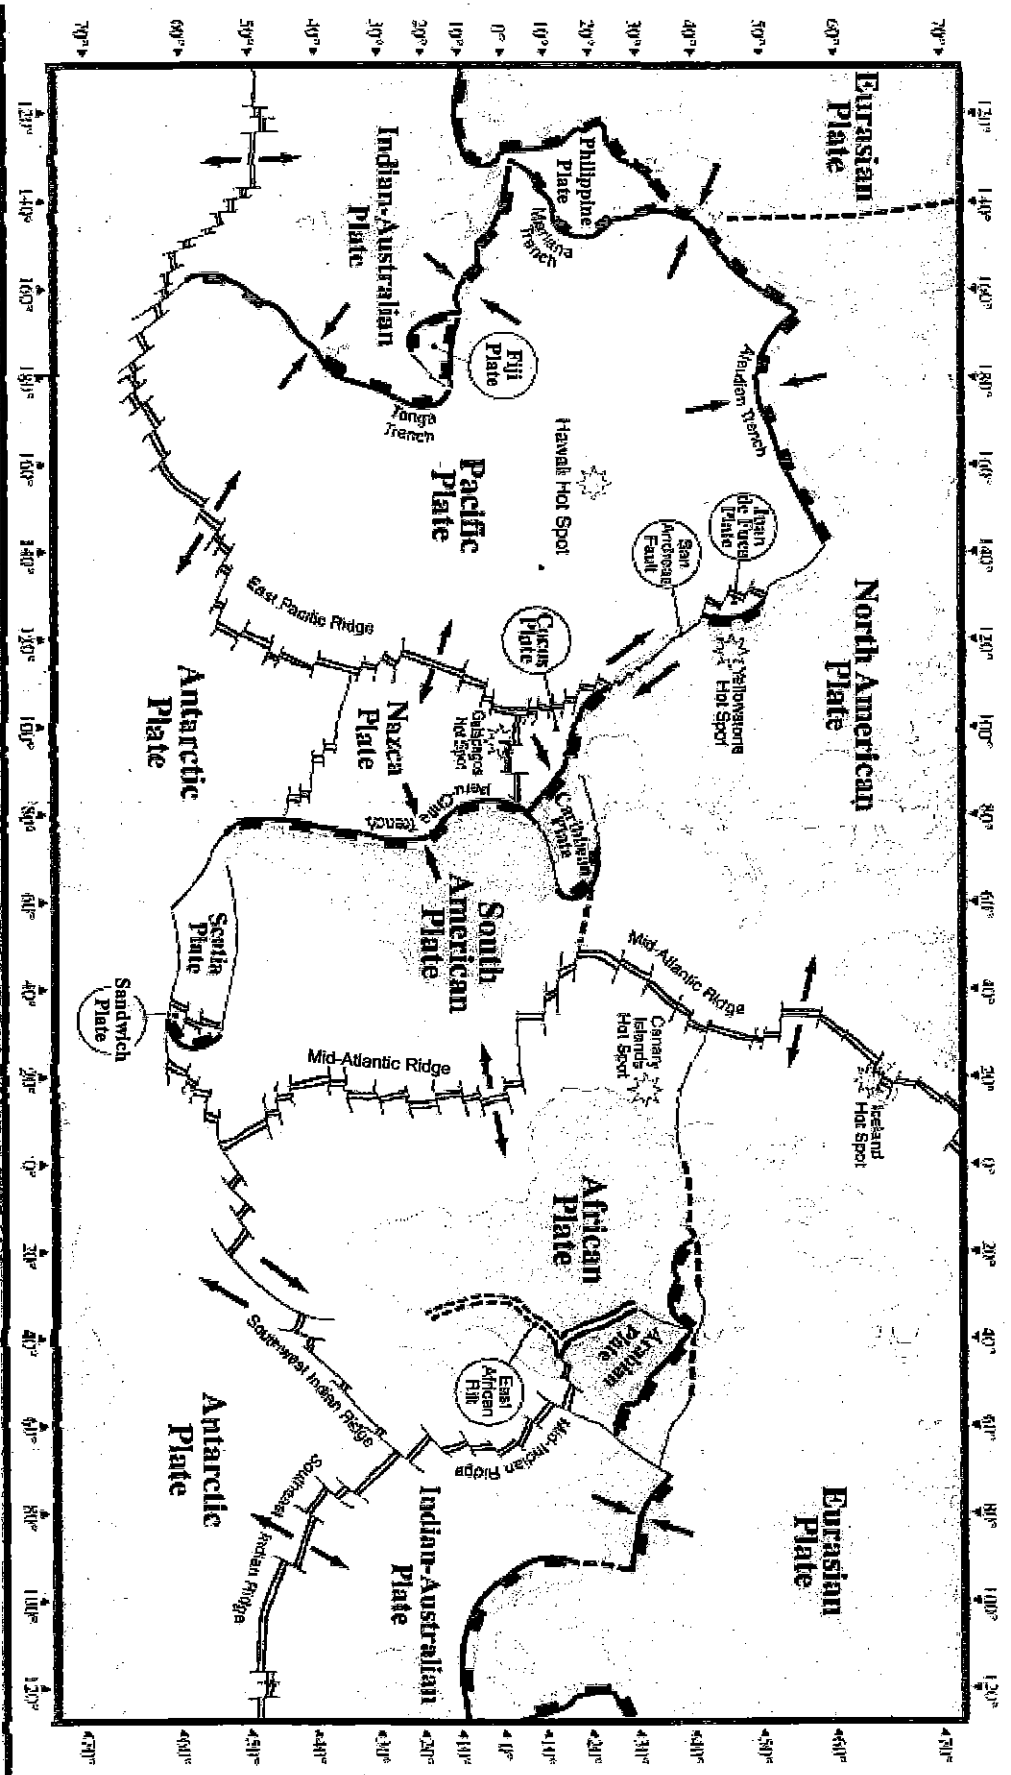

Fig. 2-4: Geological Map of the Hawaiian Islands

Tectonic Plates

KEY:

- Divergent Plate Boundary (usually broken by transform faults along mid-ocean ridges)
- Convergent Plate Boundary (Subduction Zone)
- Transform Plate Boundary (Transform Fault)
- Complex or Uncertain Plate Boundary
- Relative Motion at Plate Boundary
- Hot Spot
- Mid-Ocean Ridge

NOTE: Not all plates and boundaries are shown.
